

Using Action Signals to Facilitate a Meeting

(Title Slide) Using Action Signals to Facilitate a Meeting

Chris is seated at a table with several co-workers. He is accessing sign visually, but is relying on Haptics for information outside his field of vision. A provider is giving Chris the following information via Haptic signals.

People are looking at you, using the signal “eye gaze.”

Person is nodding.

A person with the initial “M” has walked into the room. She and another person are walking across the room. Both people sit down. Chris waits until both are situated until continuing on with the meeting.

Someone is laughing to Chris’s right.

A person is writing.

A person with the initial “V” seated to Chris’s right has raised her hand.

A person seated to his left raises her hand and starts signing. Chris looks towards the signer.

Chris is taking notes. A person seated to his right is talking, and to his left is signing at the same time. The person continues to sign. A person nods in agreement.

Chris is informed that the door has opened and a person with the initial “M” has walked into the room.

He is informed that a person to his right is drinking. Chris looks in that direction and nods.

The signal for interpreter switch is provided. Chris pauses the meeting and announces it’s time to change interpreters.
